

KAIROS - User Flow Guide

This document describes how a user moves through KAIROS, from landing on the homepage to completing their hackathon project with a generated pitch.

1. High-Level Flow Chart

2. Page-by-Step Experience

Page 1: Landing Page

- * **Visuals**: A clean, modern landing page displaying the text: **"KAIROS: Your AI Hackathon Co-Founder"**.
- * **Interaction**: A prominent **"Sign in with Google"** button.
- * **Goal**: Introduce the app and prompt the user to authenticate.

Page 2: Mandatory Profile Setup

- * **Fields**:
 - * **Name**
 - * **Primary Role** (Dropdown: Frontend Developer, Backend Developer, Full Stack Developer, AI/ML Engineer, UI/UX Designer, DevOps Engineer, Research & Pitch)
 - * **Experience Level** (Beginner, Intermediate, Advanced)
 - * **Tech Stack** (Categorized searchable tags like Python, React, PostgreSQL, Docker, etc.)
- * **Goal**: Saves this information as a structured JSON object under the user's profile.

Page 3: Teams Page

- * **Features**:
 - * **Create Team**: User inputs a Team Name. KAIROS generates a unique 6-character Code (e.g., `KAI-782`). The creator becomes the Team Leader.
 - * **Join Team**: User inputs a team code to join an existing group.
 - * **Syncing (Leader view)**:
 - * The leader sees a list of members.
 - * Clicking **"Fetch Latest Details"** pulls the latest JSON profiles of all members and updates a central `master_json`` representing the team's combined skills.

Page 4: Dashboard

- * **Features**:

- * Personal profile summary card.
- * Task alerts and blockers checklist.
- * List of joined teams.
- * List of ongoing hackathons.
- * Visual charts showing project completion status.

Page 5: Coach Page (AI Session Setup)

- * **Before generation**:
 - * Shows cards of current project sessions.
 - * Click **"New Session"** (available to Team Leaders or Solo users).
 - * Form asks for: Hackathon Name, Solo/Team selection, Problem Statement (PDF/Docx upload or Text field), and Project Idea.
- * **During generation**:
 - * A beautiful progress animation runs as the multi-agent system runs checks.
- * **After generation**:
 - * **Roadmap Pane**: Displays a visual timeline with milestone cards (phases, deliverables, dependencies, risk). The leader can add, edit, or delete milestones.
 - * **Chat Pane**: Speak directly to KAIROS to modify the roadmap (e.g., **"Make Phase 2 backend-only"**).

Page 6: Tasks Page (Execution Area)

- * **Features**:
 - * Lists all generated tasks categorized by status (Pending, In Progress, Completed, Blocked).
 - * Shows task metadata (Assigned member, Deadline, Priority, Dependency).
 - * Leaders can assign tasks to members.
 - * **Causal Blockers**: If a member marks a task as "Blocked", the system automatically creates a blocker card. If task B depends on task A, and task A is late, task B is automatically marked blocked.
 - * **AI Recommendation Engine**: Scans tasks and provides solutions (e.g., **"Reassign Task C to DevOps Engineer since they have finished their work"**).

Page 7: Pitch Page

- * **Features**:
 - * Becomes unlocked once the roadmap is generated.
 - * **Demo Flow**: Step-by-step path to show judges.
 - * **Pitch Outline**: Structured slides and speaking bullet points.
 - * **Final Pitch Showcase**: Fully detailed speech draft combining problem, solution, architecture, team contributions, and demo strategy.
 - * Chat allows modifying specific slides or talking points.

Page 8: Profile Edit Page

- * **Features**:
 - * Allows editing name, role, tech stack, and experience.
 - * Saving automatically updates the team leader's master team JSON and updates the Coach's recommendations.
